Alpha-1 Antitrypsin Deficiency *Prodigy Anesthesia*

Alpha-1 antitrypsin deficiency is a rare, homozygous syndrome in which a defective form of alpha-1 antitrypsin is produced. Alpha-1 antitrypsin is a substance that protects the elastic tissue of the lungs from neutrophil elastase. The defective form of alpha-1 antitrypsin accumulates in the liver, resulting in cirrhosis and the lack of the normal form in the lungs results in pulmonary diseases such as asthma and emphysema.
