Blood Flow Through The Heart — *Prodigy Anesthesia*

1	Venous blood from the body returns to the heart via the superior and inferior vena cavae and into the right atrium.
2	The atria contract and eject the blood out of the right atrium through the tricuspid valve and into the right ventricle.
3	The right ventricle fills with blood, and contracts, forcing the blood through the pulmonic valve.
4	The blood then passes into the pulmonary trunk,
5	which divides into the right and left pulmonary arteries, which carry the unoxygenated blood to the lungs.
6	The oxygenated blood returns from the lungs via the right and left pulmonary veins
7	and fills the left atrium. The left atrium contracts, forcing the blood through the mitral valve
8	and into the left ventricle. The left ventricle contracts and forces the blood through the aortic valve
9	into the aortic root. From the aortic root, the blood travels into the aortic arch and to the rest of the body
10	via the brachiocephalic, the left common carotid, left subclavian, and descending aortic arteries.
